Problem – Solution Fit

The Problem–Solution Fit identifies the major challenges faced by property seekers and property owners in the traditional rental process and demonstrates how the HouseHunt platform addresses these challenges through a secure, centralized, and user-friendly digital solution. The proposed system simplifies property discovery, enhances communication between owners and tenants, streamlines property management, and provides a seamless rental experience.

Purpose:

- ❑ Identifies the major problems faced by tenants and property owners in traditional property rental systems.
- ❑ Maps each identified problem to an effective solution provided by the HouseHunt platform.
- ❑ Ensures that the proposed solution addresses real user needs by providing secure authentication, efficient property management, and simplified rental services.
- ❑ Helps validate that the developed features effectively solve the identified challenges while improving user convenience, transparency, and overall satisfaction.

The **HouseHunt** platform is built using the MERN stack and follows a client–server architecture.

Users (Tenants) and Property Owners interact with the web application through the browser, which communicates with the backend server via RESTful APIs.

The backend handles authentication, property management, wishlist, reviews, visit scheduling, dashboard operations, and other services.

Data is stored securely in MongoDB Atlas, while property images are stored in the server uploads directory.

The system integrates Google Maps for location visualization and Email/WhatsApp services for owner communication.

The architecture ensures scalability, security, and a seamless experience for both property seekers and owners.
